Rehabilitation in Critical Care

Evidence Update

February 2018
(Quarterly)
Your Outreach Librarian – Helen Pullen

Whatever your information needs, the library is here to help. Just email us at library@uhbristol.nhs.uk

Outreach: Your Outreach Librarian can help facilitate evidence-based practice for all in the team, as well as assisting with academic study and research. We also offer one-to-one or small group training in literature searching, critical appraisal and medical statistics. Get in touch: library@uhbristol.nhs.uk

Literature searching: We provide a literature searching service for any library member. For those embarking on their own research it is advisable to book some time with one of the librarians for a 1 to 1 session where we can guide you through the process of creating a well-focused literature research. Please email requests to library@uhbristol.nhs.uk

Training Calendar 2018

All sessions are one hour

February (12.00-13.00)
1st (Thu) Literature Searching
9th (Fri) Critical Appraisal
12th (Mon) Statistics
20th (Tue) Literature Searching
28th (Wed) Critical Appraisal

March (13.00-14.00)
8th (Thu) Statistics
12th (Mon) Literature Searching
20th (Tue) Critical Appraisal
28th (Wed) Statistics

April (12.00-13.00)
5th (Thu) Literature Searching
9th (Mon) Critical Appraisal
17th (Tue) Statistics
25th (Wed) Literature Searching
Can Early Rehabilitation on the General Ward After an Intensive Care Unit Stay Reduce Hospital Length of Stay in Survivors of Critical Illness?: a Randomized Controlled Trial

   **Abstract:** Prevalence of pre-existing frailty in patients admitted to the intensive care unit (ICU) is increasing. Critical illness leads to a catabolic state that further diminishes body reserves and contributes to frailty independent of age and prehospital functional status. Because early mobilization of patients in the ICU results in accelerated recovery and improvement in functional status and quality of life, frailty can severely affect the mobility of patients in ICU ultimately prolonging recovery. Understanding the concept of frailty and the association of frailty and its impact on mobility in the ICU, identifying patients, and timely resource allocation helps in optimum care and improves clinical outcomes.

   **PubMedID:** 28743548
   
   **Abstract:** Mechanically ventilated patients can be at risk for functional decline (Cameron et al., 2015). Early mobilisation of mechanically ventilated patients can improve outcomes after critical illness to prevent this decline. Although registered nurses understand the importance of early mobilisation there are nurses who are unwilling to mobilise patients. AIMThe aim of this study is to examine whether nurses’ attitudes and beliefs are barriers for early mobilisation and evaluate whether an education intervention can improve early mobilisation. METHOD Pre-test, post-test intervention with registered nurses and charge nurses in a 22 bed trauma intensive care setting. PROCEDURE Pre-test, post-test survey assessed perceived barriers in knowledge, attitudes, and behaviours followed by targeted education. RESULTS Dependent Sample T-test revealed a statistically significant increase in post-test responses for the subscales knowledge, attitudes, and behaviours with early mobilisation. This over-all increase in post-test results support that understanding barriers can improve patient outcomes. CONCLUSION Use of structured surveys to identify barriers for early mobilisation among nursing can assist in providing targeted education that address nurse’s perception. The education intervention appeared to have a positive impact on attitudes but it is unknown if the difference was sustained over time or affected participants practice or patient outcomes.

Can Early Rehabilitation on the General Ward After an Intensive Care Unit Stay Reduce Hospital Length of Stay in Survivors of Critical Illness?: A Randomized Controlled Trial.

Author(s) Gruther, Wolfgang; Pieber, Karin; Steiner, Irene; Hein, Cornelia; Hiesmayr, Jörg Michael et al.

Source American journal of physical medicine & rehabilitation; Sep 2017; vol. 96 (no. 9); p. 607-615

OBJECTIVE The aim of this study was to evaluate if an early rehabilitation program for survivors of critical illness improves functional recovery, reduces length of stay, and reduces hospital costs. DESIGN This was a prospective randomized controlled trial. Fifty-three consecutive survivors of critical illness were included in the study. After discharge from the intensive care unit, the intervention group received an early rehabilitation program, and the standard-care group received physical therapy as ordered by the primary care team. Length of stay at the general ward after transfer from the intensive care unit was recorded. In addition, Early Rehabilitation Barthel Index, visual analog scale for pain, 3-minute walk test, Beck Depression Inventory, State-Trait Anxiety Inventory, and Medical Research Council scale were used. RESULTS In the per-protocol analysis, length of stay at the general ward was a median 14 days (interquartile range [IQR], 12-20 days) in the early rehabilitation and 21 days [IQR, 13-34 days) in the standard-care group. This significant result could not be confirmed by the intention-to-treat analysis (16 days [IQR, 13-23 days] vs. 21 days [IQR, 13-34 days]). Secondary outcomes were similar between the groups. Hospital costs were lower in the intervention group. No adverse effects were detected. CONCLUSIONS: An early rehabilitation program in survivors of critical illness led to an earlier discharge from the hospital, improved functional recovery, and was also cost-effective and safe.

TO CLAIM CME CREDITS Complete the self-assessment activity and evaluation online at http://www.physiatry.org/JournalCME

CME OBJECTIVES: Upon completion of this article, the reader should be able to (1) delineate the benefits of early rehabilitation on a general medicine ward after an intensive care unit stay, (2) recognize the safety of appropriately implemented early rehabilitation, and (3) incorporate early rehabilitation on the general medical ward as applicable.

LEVEL Advanced ACCREDITATION: The Association of Academic Physiatrists is accredited by the Accreditation Council for Continuing Medical Education to provide continuing medical education for physicians. The Association of Academic Physiatrists designates this Journal-based CME activity for a maximum of 0.5 AMA PRA Category 1 Credit(s)™. Physicians should only claim credit commensurate with the extent of their participation in the activity.
